

Distributed learning.ai: Towards a Distributed Learning Network for Cancer Registries

Gijs Geleijnse

Dilemma

- A research question that requires *pooling* sensitive data from multiple cancer registries:
 - Because separate analyses do not give me all the insights
 - Because separate data sets are **too small**

Dilemma

- A research question that requires *pooling* sensitive data from multiple cancer registries:

ses

sets

- With current privacy protection acts in place, sharing patient data across borders may be **difficult**

A different approach

- If sharing is the problem: **don't share the data!**
- If you can't bring the data to your statistical software ...
you have to bring the statistics to the data
- Consequences:
 - The algorithm (logistic regression, Cox PH, ...) has to be distributed
 - Only aggregated data is shared and combined
 - The data formats have to be aligned

DataSHIELD: taking the analysis to the data, not the data to the analysis

Oral Cavity: Taiwan & The Netherlands

- Can we implement an open source, distributed, privacy preserving Cox PH analysis?
- Does survival of oral cavity carcinoma differ between Taiwan and the Netherlands? And if so, which factors contribute to the variation?

	Other treatment	6,85 (5,84 - 8,03)	4,21 (3,55 - 4,99)
	Primary radiotherapy	4,15 (3,87 - 4,46)	1,98 (1,82 - 2,16)
	Surgery and chemo	1,63 (1,35 - 1,97)	1,40 (1,15 - 1,70)
	Surgery and radiotherapy	1,81 (1,71 - 1,92)	1,00 (0,93 - 1,07)
	Unknown	3,89 (3,19 - 4,74)	4,19 (3,37 - 5,22)

Conclusions

- We presented a working, open-source system to analyse combined privacy-sensitive data – without sharing data
- System can support cross-registry research by addressing data governance issues
